# Distributed Generation and Energy Storage

What is distributed generation?

Distributed generation (DG) refers to electricity generation done by small-scale energy systems installed near the energy consumer. These systems are called distributed energy resources (DERs) and commonly include solar panels, small wind turbines, fuel cells and energy storage systems.

What is distributed energy storage?

Distributed energy storage is also a means of providing grid or network services which can provide an additional economic benefit from the storage device. Electrical energy storage is shown to be a complementary technology to CHP systems and may also be considered in conjunction with, or as an alternative to, thermal energy storage.

Do distributed energy storage systems improve reliability and resilience?

Extensive research has been conducted on the optimized placement of distributed energy storage systems to improve the reliability and resilience of distribution power systems. However, several limitations and areas for improvement remain, as highlighted in prior studies.

What is distributed energy resources (DER)?
