# Flow Battery Differential Pressure Control

What is a differential pressure controller?

This device has two functions: 1) A differential pressure controller maintains fixed differential pressure over the flow restrictor(flow control). This ensures automatic flow limitation,independent of pressure variations in the system.

What is a differential pressure controller & flow controller / limiter?

It supplies 18-20% of the annual heat consumption in the city of Silkeborg, Denmark, which has an ambitious target of CO<sub>2</sub> neutrality in heat production by the year 2030. Differential Pressure Controllers & Flow Controllers / Limiters controls the flow available for each consumer as well as the differential pressure control at the substation.

What is a combined differential pressure controller & flow controller (PQ)?

A combined differential pressure controller and flow controller (PQ) consists of two independent differential pressure controllers and a flow restrictor (manual balancing valve) integrated in one valve body. This device has two functions:

Is a flow control system useful for large-scale vanadium redox flow battery systems?

Therefore,a sophisticated flow control system is valuablefor large-scale vanadium redox flow battery systems and is worthy of further investigation and development. J. Electrochem.

The decoupled power and energy output of a redox flow battery (RFB) offers a key advantage in long-duration energy storage, crucial for a successful energy transition. ...
