
Saint Lucia Super Farad Capacitor

What are supercapacitors & EDLC?

Supercapacitors, also known as ultracapacitors and electric double layer capacitors (EDLC), are capacitors with capacitance values greater than any other capacitor type available today. Supercapacitors are breakthrough energy storage and delivery devices that offer millions of times more capacitance than traditional capacitors.

What does L1 & L2 mean in a supercapacitor?

L1= Load life rating of the super capacitor (typically 1000 hours at rated temperature). L2= expected life at operating condition. Tm= Maximum temperature rating of the supercapacitor. Ta= Ambient temperature the supercapacitor is going to be exposed to in the application. Vr = rated voltage of capacitor. Warning.

What are supercapacitors & how do they work?

Supercapacitors are breakthrough energy storage and delivery devices that offer millions of times more capacitance than traditional capacitors. They deliver rapid, reliable bursts of power for hundreds of thousands to millions of duty cycles - even in demanding conditions.

Are supercapacitors suitable for pulse power applications?

Supercapacitors are ideally suited for pulse power applications, due to the fact the energy storage is not a chemical reaction, the charge/discharge behavior of the supercapacitor is efficient. Supercapacitors are utilized as temporary energy sources in many applications where immediate power availability may be interrupted.
