
The grid needs energy storage projects

Why do we need a grid-scale energy-storage system?

Under some conditions, excess renewable energy is produced and, without storage, is curtailed^{2,3}; under others, demand is greater than generation from renewables. Grid-scale energy-storage (GSES) systems are therefore needed to store excess renewable energy to be released on demand, when power generation is insufficient⁴.

Are battery energy-storage technologies necessary for grid-scale energy storage?

The rise in renewable energy utilization is increasing demand for battery energy-storage technologies (BESTs). BESTs based on lithium-ion batteries are being developed and deployed. However, this technology alone does not meet all the requirements for grid-scale energy storage.

Why are microgrids and energy storage systems important?

Microgrids and energy storage systems are increasingly important in today's dynamic energy market. ESS and microgrids offer restricted, resilient, and environmentally responsible energy solutions by storing and using power generated from renewable sources.
