
What is the use of solar grid-connected inverter

What is an on grid solar inverter?

An on grid solar inverter is a key component in solar power systems that are connected to the main power grid. Its primary function is to convert the direct current (DC) electricity generated by solar panels into alternating current (AC) electricity, which is compatible with the utility grid.

How do on-grid solar inverters work?

In solar photovoltaic systems, on-grid solar inverters are one of the indispensable core devices. They can not only convert the direct current (DC) generated by solar panels into the alternating current (AC) we use daily, but can also feed surplus electricity into the grid. So,

How do inverters provide grid services?

In order to provide grid services, inverters need to have sources of power that they can control. This could be either generation, such as a solar panel that is currently producing electricity, or storage, like a battery system that can be used to provide power that was previously stored.

Should you use a grid-tied solar inverter?

You will always experience some advantages when using a grid-tied solar inverter compared to other solar panel systems. Rather than a hybrid system with a battery, this is way cheaper. This system needs only a few pieces of equipment so the initial cost is always low. This will meter the surplus power which you can sell to the grid.
